NAMM 2017 press release: Bastl Instruments introduce the KLIK

We are happy to announce our new product: the KLIK!

It is a synchronisation device that enables the user to make rock solid analog sync signals from their computer and hardware synths. The KLIK revives the old-school sync technique of using audio tracks for synchronisation purposes. Record your synths exactly on the grid into your DAW while compensating for the latency of your sound card. Jam between your computer and your HW in a really tight sync and add groove to your clock.

We have collaborated with Bitwig and Irrupt Audio to make the KLIK as powerful and easy to use as possible and are presenting this collaboration for the first time at NAMM 2017. Check us out and try the KLIK at booth C4911 !

The new version of Bitwig (2.0) adds a HW CLOCK device which we collaborated on to use with the KLIK!

Please note that the KLIK is designed to only transmit clock / trigger information. Its output is either low or high 0 or 5V. It doesn't output continuous CV signals.
